INTRODUCTION

The **Vendor and Purchase Management System** is a web-based application designed to streamline and automate the process of managing vendor information and purchase transactions within an organization. In many small and medium-sized businesses, vendor details and purchase records are often maintained manually using paper files or spreadsheets. This traditional approach is time-consuming, prone to human errors, difficult to maintain, and inefficient for generating reports.

To overcome these challenges, this system provides a digital solution that stores vendor and purchase data in a structured database. The application enables users to easily add, update, delete, and retrieve records through a user-friendly web interface. By automating routine tasks and organizing information systematically, the system improves operational efficiency, data accuracy, and accessibility.

FEATURES OF THE WEBSITE:-

1. Vendor Management

- Add new vendor details
- Update existing vendor information
- Delete vendor records
- View complete vendor list

2. Purchase Management

- Add new purchase transactions
- Edit or delete purchase records
- Link purchases to specific vendors

- View purchase history

3. Digital Data Storage

- Store vendor and purchase data in a structured database
- Maintain organized and secure records.

4. Search and Quick Access

- Search vendors and purchases easily
- Quick retrieval of stored information

5. Report Generation

- View purchase summaries
- Calculate total expenses

6. User-Friendly Interface

- Simple and easy-to-use web design
- Clear forms for data entry

7. Error Reduction

- Form validation to prevent wrong or empty entries
- Reduce manual paperwork and calculation mistakes

OBJECTIVE

The main objectives of the Vendor and Purchase Management System are:

- * To develop a centralized system for storing and managing vendor information.
- * To record purchase transactions in a structured and organized manner.
- * To minimize paperwork and reduce manual data entry errors.
- * To enable quick searching and retrieval of vendor and purchase details.
- * To generate purchase summaries and reports efficiently.
- * To design a simple and user-friendly web interface.
- * To improve overall productivity and data management within the organization.

SCOPE OF THE PROJECT

The scope of this project is focused on developing a basic yet functional vendor and purchase management application suitable for small and medium-sized enterprises.

The system includes the following features:

- * Adding, updating, deleting, and viewing vendor details.
- * Recording purchase transactions linked to specific vendors.
- * Viewing purchase history and transaction details.
- * Searching vendors and purchases based on specific criteria.
- * Maintaining organized digital records for future reference.

Although the current version provides core management functionality, the system can be further enhanced in the future by integrating:

- * User authentication and role-based access control.
- * Invoice and billing generation.
- * Advanced reporting and data visualization.
- * Integration with accounting systems.
- * Exporting reports in PDF or Excel format.
- * Email notifications for purchase confirmations.

This flexibility makes the project scalable and adaptable to growing business needs.

TECHNOLOGY USED

The project is developed using the following technologies:-

Frontend

- * HTML – For designing the structure of web pages.
- * CSS – For styling and improving visual presentation.

Backend

- * Python (Flask Framework) – Handles server-side logic, routing, form processing, and communication between the frontend and database.

Database

- * SQLite – A lightweight relational database used to store vendor and purchase data securely and efficiently.

Development Tools

- * Visual Studio Code (VS Code)– Code editor used for development.
- * Web Browser – For testing and running the application.

CONCLUSION

The Vendor and Purchase Management System provides an efficient and reliable solution for managing vendor records and purchase transactions digitally. By replacing manual record-keeping methods, the system reduces human errors, saves time, and enhances data accuracy. The centralized database ensures better organization and easy retrieval of information whenever required.

Overall, this project demonstrates how Python and HTML can be effectively used to develop practical business management applications. It improves productivity, ensures better data management, and provides a foundation for future enhancements.
